Attorney's Docket No.: 42P15739

**IN THE UNITED STATES PATENT AND TRADEMARK OFFICE**

In re Application for:

**Francis X. McKeen**

Application No.: 10/644,399

Filed: August 19, 2003

For: **METHOD AND APPRATUS TO  
PROVIDE PROTECTION FROM A  
BUFFER OVERFLOW ATTACK**

Examiner: Meonske, Tonia L.

Art Group: 2181

Conf. No.: 7924

**DECLARATION PURSUANT TO 37 C.F.R. §1.131**

Mail Stop Amendment  
Commissioner for Patents  
P. O. 1450  
Alexandria, VA 22313-1450

Dear Sir:

I, Francis X. McKeen, hereby declare that:

1. I am a citizen of the United States of America.
2. I currently reside at 10612 NW LeMans Ct. Portland, OR 97229.
3. I am currently an employee of Intel Corporation in Santa Clara, California.
4. I have been an employee of Intel Corporation since Oct 30, 1995.
5. My current title at Intel Corporation is Hardware Engineer.
6. I am the sole-inventor of the above-identified patent application.

7. I have reviewed U.S. Patent 6,996,677 issued to Lee et al. ("Lee"), which was filed on February 20, 2003. Lee claims priority from provisional patent application No. 60/429,839 filed on November 25, 2002. The Examiner cites Lee against the claims of the above-identified application.

8. The invention disclosed and claimed in the above-identified patent application was conceived in the United States of America at least as early as October 18, 2002, as evidenced by Intel Corporation Invention Disclosing Form (IDF) having ID #28002 (a copy of which is attached herein). This document was reduced to writing internally within Intel Corporation at least as early as the date on the document; i.e., October 18, 2002. The foils referenced by the IDF is a presentation entitled "LT Stack Protection," (a copy of which is attached herein). This document demonstrates conception of the claimed invention of the instant application. Although Revision 0.1 of the LT Stack Protection document indicates an August 28, 2007 date, as indicated in the attached screen print, the document was first created on March 9, 2001. Revision 1 of the LT Stack protection document was completed at least as early as the date on the date on the IDF document; i.e., October 18, 2002. Between at least October 2002 and its constructive reduction to practice by the filing of the above-captioned patent application on August 19, 2003, I directed simulations and various testing in a diligent effort to reduce the invention to practice. Therefore, the conception and diligence towards reduction to practice of the invention disclosed and claimed in the above-identified patent application occurred prior to the filing date of Lee.

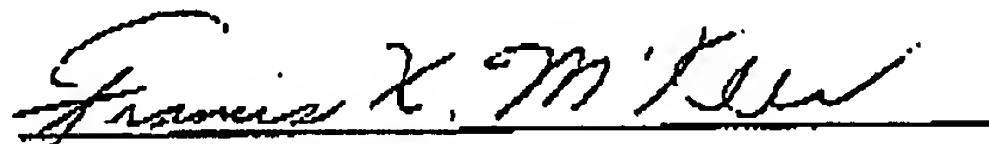

9. The documents provided herewith are confidential. It is Intel Corporation's practice to maintain in secrecy all confidential documents. I believe that the documents have at all times prior to the filing date of the above-captioned application been maintained in a confidential manner.

I hereby declare that all statements made herein of my own knowledge are true and that all statements made on information and belief are believed to be true; and further that these statements were made with the knowledge that willful false statements and the like are

punishable by fine or imprisonment, or both, under Section 1001 of Title 18 of the United States Code, and that such willful false statements may jeopardize the validity of the above-identified application or any patent issued thereon.

Respectfully submitted,

Dated: August 30, 2007

  
Francis X. McKeen

It is important to provide accurate and detailed information on this form. The information will be used to evaluate your invention for possible filing as a patent application. Invention Disclosure forms **MUST** be sent electronically via email to your manager/supervisor who should then forward with their approval to our email account "invention disclosure submission." If you have any questions, please call 8-264-0444.

**(PROVIDE SAME INFORMATION AS ABOVE FOR EACH ADDITIONAL INVENTOR)**

2. Title of Invention: A mechanism to protect from Stack Smashing Attacks on LT
---

3. What technology/product/process (code name) does your invention relate to (be specific if you can) La Grande Technology
--

4. Include several key words to describe the technology area of the invention in addition to # 3 above: <u>Buffer overflow, Stack smashing, virus attack</u>
---

5. Stage of development (i.e. % complete, simulations done, test chips if any, etc.): Conceptual
--

6a. Has a description of your invention been (or planned to be) published outside of Intel: No.
If YES, was the manuscript submitted for pre-publication approval through the Author Incentive Program:
If YES, please identify the publication and the date published:

6b. Has your invention been used/sold or planned to be used/sold by Intel or others? No.

If YES, date it was sold or will be sold:

6c. Does this invention relate to technology that is or will be covered by a SIG (special interest group)/standard or specification?  
No.

If YES, name of SIG/standard/specification:

6d. If the invention is embodied in a semiconductor device, actual or anticipated date of tapeout?  
Could be fall of 2009

6e. If the invention is software, actual or anticipated date of any beta tests outside Intel: Soon

7. Was the invention conceived or constructed in collaboration with anyone other than an Intel blue badge employee or in performance of a project involving entities other than Intel (e.g. government, other companies, universities or consortia)? NO: If YES, name of individual or entity:

8. Is this invention related to any other invention disclosure that you have recently submitted? If so, please give the title and inventors: No.

**PLEASE READ AND FOLLOW THE DIRECTIONS ON  
HOW TO WRITE A DESCRIPTION OF YOUR INVENTION**

**Try to limit your description to 2-3 pages  
Do NOT attach a presentation, white paper, or specification  
ANSWER ALL OF THE QUESTIONS BELOW**

**Please provide a description of the invention and include the following information:**

- 1. Describe in detail what the components of the invention are and how the invention works.**  
See folls inserted in email
- 2. Describe advantage(s) of your invention over what is currently being done.**  
Currently there is no defense against buffer overflows and stack smashing attacks. A proposal to support a non LT version of dual stacks has been written up in an academic paper, Architectural Support for Defending Against Buffer Overflow Attacks, Xu, Kalbarczyk, Patel, Iyer, from the Center for Reliable Computing, University of Illinois, Urbana. There proposal is not the first to propose dual stacks. In this proposal there is no need to change legacy software to support the
- 3. You MUST include at least one figure illustrating the invention. If the invention relates to software, include a flowchart or pseudo-code representation of the algorithm.**  
See the foliset
- 4. Value of your invention to Intel (how will it be used?).**  
Allows Intel computers to stop spread of virus.
- 5. Explain how your invention is novel. If the technology itself is not new, explain what makes it different.**  
This invention allows virus protection of legacy code by use of the LT monitor. It allows LT to protect the LHS code integrity.
- 6. Identify the closest or most pertinent prior art that you are aware of.**  
See paper reference above.
- 7. Who is likely to want to use this invention or infringe the patent if one is obtained and how would infringement be detected? AMD, Microsoft**

**HAVE YOUR SUPERVISOR READ AND FORWARD IT ELECTRONICALLY  
VIA E-MAIL TO "INVENTION DISCLOSURE SUBMISSION"**

BY APPROVING, I (SUPERVISOR) ACKNOWLEDGE THAT I HAVE READ AND UNDERSTAND THIS  
DISCLOSURE, AND RECOMMEND THAT THE HONORARIUM BE PAID

## **Stack Smash Attacks**

- Stack Smashing attacks account for ~ 50% of security vulnerabilities reported.
- All major worms used stack smashing to bypass control of the machine
- LT does not currently solve stack smashing problem
  - LT would not protect against Code Red, Nimda, etc.
- LT impact on current internet security problems is limited to DRM and e-commerce

**Enhance LT to reduce stack smashing**

*Intel Confidential*

**MPG**

Mobile Platforms Group

# How smashing works

Before attack

Parameters
Return Address
Saved FP
Buffer[n]
Buffer
Buffer[0]
Local variable
Local variable

Stack grows downward

After attack

Parameters
Address of bypass code
Virus code
Virus code
Virus code
Virus code
Local variable
Local variable

Fill buffer and more to overwrite return address

- Data is written past the end of the buffer
  - Overwrites the return address
- Return address points to code which will redirect the program to new spot

**MPG**

Mobile Platforms Group

# Smashing protection

- Each Call deposits address in both stacks
- Each return checks that addresses match
- Failed matches are attacks.

Intel Confidential

**MPG**

Mobile Platforms Group

## **Protection with LT**

- **Push the control stack into LT space where only the microcode and SVM can touch it.**
  - Protects against other programs smashing both stacks
- **Microcode checks two stacks to validate correct address**
- **VMExit generated when the two values miscompare**
- **VMCS contains a bit which indicates the feature is enabled for a guest**
  - VMExit generated on loads to SP which relocate it.
  - Monitor maintains copy of the control stack.

*Intel Confidential*

7

Mobile Platforms Group

## **Changes**

- **Microcode checks the values on both stacks**
  - Can we experiment with patch?
- **A second SP defined which points at the control stack. Each time the SP is loaded the CSP must be loaded.**
- **How do we determine live/dead for stacks?**
  - Memory once used for stack could be kept active for a long time
  - All stacks are part of the memory image
  - Monitor keeps CSP as long as the stack is kept in memory.
